## Immediate implant placement and restoration in the esthetic area: clinical workflow

Implant dentistry reached predictable results in many different conditions and represents actually a first choice solution in many cases of partial and total edentulism.

One of the most attractive applications is represented by immediate placement at extraction stage. Despite the high appeal for patients and clinicians, immediate implantation is extremely challenging.

It requires to keep under control a high number of factors: possibility to get sufficient primary stability placing the fixture in 3D prosthetically driven position, considering natural socket remodeling in time, avoiding early contamination. Frequently is necessary to manage empty spaces through regenerative procedures and soft tissue deficiencies.

In the esthetic area, immediate implantation is more and more risky, but in many cases it offers the possibility to maintain the hard and soft architecture after tooth extraction using specific procedures and devices.

Immediate implantation in the esthetic area can be considered a complex procedure, frequently associated to GBR techniques and prosthetic devices. Host tissue situation and Biomaterials selection is one of the key factors for this class of cases.

In order to maintain the architecture of hard and soft tissue in the esthetic area is possible to realize an immediate restoration procedure. This option is quite challenging and must be critically evaluated.

TERMIN: 08.09.2021

CZAS TRWANIA: 18:00

MIEJSCE: Centrum Edukacji Proimplant

C. Śniegockiej 8, Warszawa

REJESTRACJA: warszawa@itistudyclub.pl LUB powisle@itistudyclub.pl

KOSZT: 350 zł

Bezpłatny udział dla członków ITI
